

MOBILIS

ems anyware

What is Mobilis?

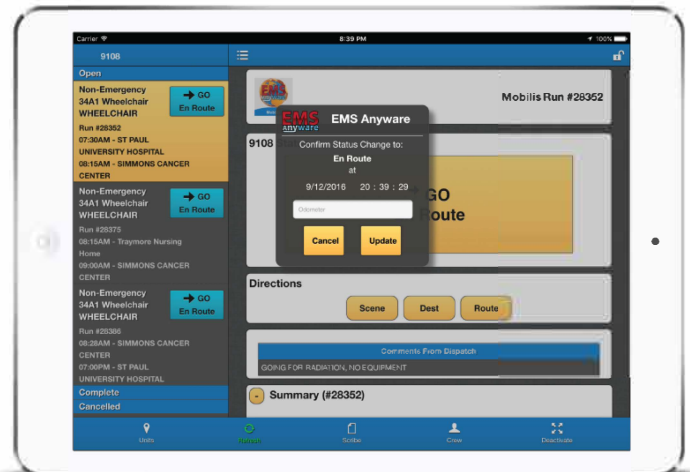

Mobilis is a modern version of an in-vehicle Mobile Data Terminal. Integrating with Google and Apple Maps, it provides you with real-time views of your trips, and allows management to assign trips to employees who receive notifications within the smartphone (iOS or Android) app. Mobilis provides supplemental vehicle GPS tracking in lieu of vehicle AVL units.

Benefits of Mobilis

Mobilis connects with ZOLL RescueNet allowing your employees to save time and be more efficient with getting patients on the road.

Mobilis Features

- Auto Odometer
- Link Round Trips
- Wheels Rolling Tracking
- Link trips to same destination
- Multiple devices per unit
- Configurable alert types
- Geofence based timestamps

By utilizing mobile devices, Mobilis improves travel time, offers the best routes, and allows for clear communication --- reducing verbal radio traffic, missed unit status changes, and dispatch staffing needs. Mobilis makes it clear where each ambulance is, where each crew member is, and who is doing what. Mobilis provides consistent measurements to improve performance and efficiency.
